RoboShare

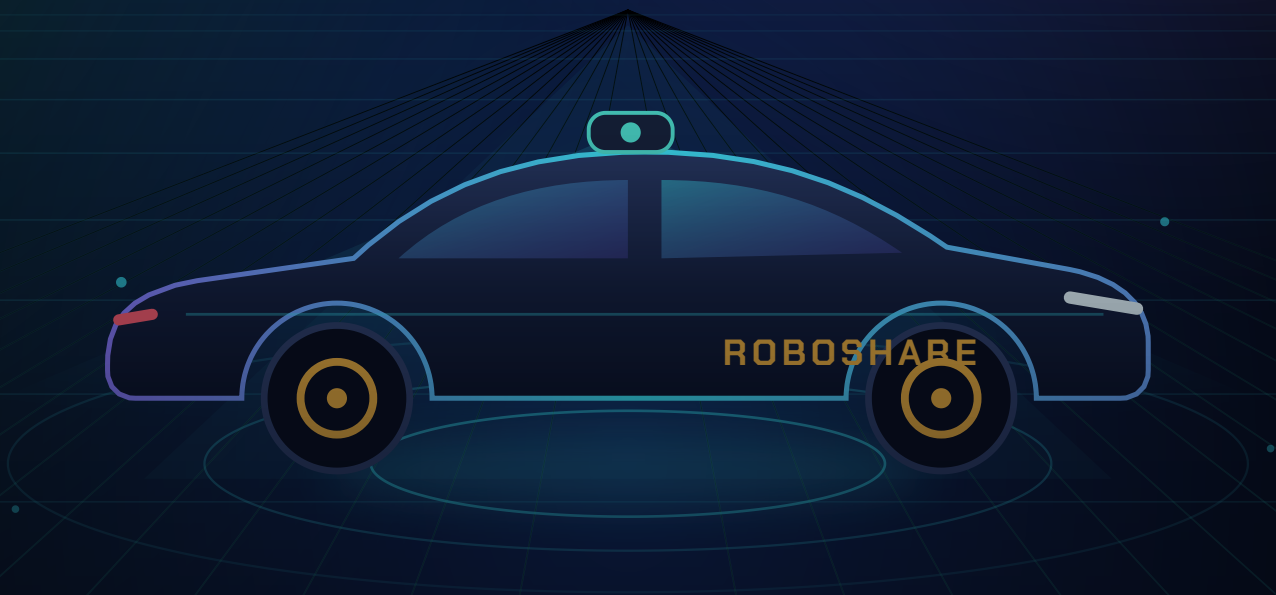

ROBOTAXI · RWA

WHITEPAPER

RoboShare

Unit-based participation in the operating profit of autonomous ride-hailing vehicles.
Settled in USDT, governed by smart contracts, auditable on-chain.

- 1 vehicle = 100 units
- USDT in · monthly payouts
- Auto-start when fully funded
- 2-of-3 multisig governance

Version 0.3 draft
October 2026

This document is a draft that describes the product design. It is not an offer or solicitation to buy or sell any security or investment. Subject to legal review before any offering.

CONTENTS

Contents

RoboShare splits the operating profit of a single robotaxi into 100 units, issued per vehicle and distributed every month. Here is how it works.

01	One vehicle, one project, 100 units	Each vehicle is its own project
02	Making vehicle income accessible and verifiable	Access, transparency, payouts
03	From subscription to payout	Four steps
04	What you hold	What a unit represents
05	Offering rules	Supply, price, minimum, escrow
06	How payouts are calculated	Profit, fee tiers, example
07	Transfer market	Exiting early
08	Referral rewards and promotion teams	Three levels, paid from the platform's 30%
09	Rules enforced by contracts	Evidence, separation of duties, self-custody
10	Architecture	BNB Chain contracts and services
11	Compliance and identity checks	Current status and launch conditions
12	Roadmap	Done, in progress, launch gate
13	Before you invest	Summary of key risks
14	Important notice	Nature and limits of this document

01 · OVERVIEW

One vehicle, one project, 100 units

RoboShare issues and manages robotaxi profit units on BNB Smart Chain. Each vehicle is a separate project with 100 units. Investors subscribe with USDT and, during the vehicle's operating term, share its audited distributable profit in proportion to the units they hold; at the end of the term the vehicle is sold and the proceeds are returned to holders pro rata.

100 units
Per project, capped in the contract; no further issuance

USDT
Subscriptions, refunds and payouts all use BEP20 USDT

70% yours
Investors always keep 70% of every payout; referral rewards never come out of it

2/3
Multisig controls every contract; each admin action needs 2 of 3 signers

Transparency is the core of the platform: who holds what, what each period reported, who approved it and what was paid are all linked through on-chain transactions and document hashes that anyone can check.

Settlement, the start of operations and monthly payouts all run automatically; investors only claim their USDT under "My assets". Units sit in the investor's own wallet and the platform cannot move them. Distribution rules are fixed in the contracts at deployment.

02 · WHY

Making vehicle income accessible and verifiable

A robotaxi in service earns money every day, yet ordinary investors can hardly take part:

High barriers
Each vehicle needs its own legal structure, so small stakes in a single vehicle are hard to offer.

Opaque books
Investors rarely see, or can check, the evidence behind reported numbers.

Manual payouts
Profit calculation and payment are handled by hand: slow and error-prone.

RoboShare accounts for each vehicle separately and issues it in units. Operating reports are recorded on-chain after review, payouts are generated automatically every month, computed by the contract, and claimed by investors themselves.

03 · HOW IT WORKS

From subscription to payout

01

Pick a project

Review the vehicle, unit price, operating term, minimum units and offering period.

02

Subscribe in USDT

Approve once, then buy by choosing a number of units. Funds stay in contract escrow until settlement.

03

Auto-start when funded

A successful offering settles by itself, units arrive in your wallet and the vehicle goes into service, with no button for anyone to press.

04

Monthly payouts

Early each month the system totals last month's operating data, files and reviews the report, then pays out; claim your USDT in one tap.

Visible every day

Each vehicle's daily operating income shows under "My assets", marked "pending settlement", and is distributed after the monthly settlement.

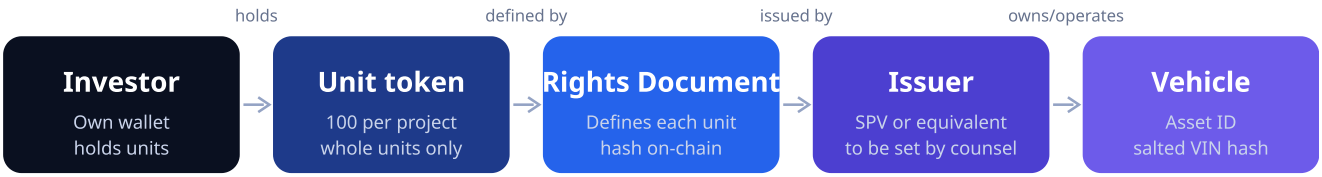

Operating term

Each vehicle has its own term, 720 days by default, shown before you subscribe. At the end the vehicle is sold and proceeds go to holders pro rata, with no platform share.

04 · RIGHTS

What you hold

A unit is a contractual economic right to a pro-rata share, by units issued, of the project's distributable profit, as defined in that project's Rights Document.

- With all 100 units sold, 1 unit = 1% of distributable profit; with 80 sold, 1 unit = 1/80 (1.25%).
- A unit is **not** ownership of the vehicle or equity in the operator, and gives no claim on other projects.
- One project, one vehicle, one issuer, one token: projects are ring-fenced by design.
- At the end of the term the vehicle is sold; net proceeds, unused reserves and insurance payouts go to holders pro rata, with no platform share.

Offering rules

Item	Rule
Supply	100 whole units per project, capped in the contract, no further issuance
Price	A fixed unit price in USDT, set before each offering opens
Operating term	Set per vehicle, 720 days by default; published before subscription
Minimum units	Set before launch (1–100); reached at close means success, otherwise full refund
Per wallet	No per-wallet limit by default; a wallet can buy until the offering sells out
Escrow	Subscriptions are held by the offering contract until settlement; no role can divert them
Auto-settlement	Settles automatically when sold out, or at close once the minimum is reached; units go straight to subscribers' wallets, minted only by that project's offering contract
Start of service	After settlement the vehicle goes into service automatically and starts earning
Unsold units	Before the close the platform may buy remaining units with its own funds; units still unsold are never issued, and profit is shared over units issued

Only two possible outcomes

Minimum reached: settled

If units sold at close reach the preset minimum, the offering settles. The offering settles automatically: units go to subscribers, proceeds go to the issuer treasury and the vehicle goes into service.

Minimum missed: full refund

If fewer units were sold, the offering is cancelled and every subscriber can take back their full USDT.

How payouts are calculated

Daily operating data is entered into the system; early each month it totals last month's data into a financial report, which is recorded on-chain once reviewed. Distributable profit is:

Actual revenue − Operating costs (charging, cleaning, upkeep, insurance) − Approved reserves − Senior obligations (debt service, taxes) = **Distributable profit D**

A period with zero or negative profit pays nothing, and the platform takes nothing.

70 : 30 split: investors 70%, platform 30%

There is no management fee and no subscription or transfer fee. Of what each holder receives pro rata, the investor keeps 70% and the platform takes 30%, however many units they hold. The platform's 30% covers vehicle management, technology and compliance costs, and referral rewards.

Item	Share	Note
Investor keeps	70%	Fixed, with or without a referrer
Platform share	30%	Referral rewards are paid out of this 30%
End-of-term return	0%	Vehicle sale proceeds returned pro rata, no platform share

The 70:30 split applies to newly issued projects; projects already issued keep the rate published in their offering.

Worked example `illustration only`

Assume distributable profit D = 10,000 USDT for a month and 100 units issued:

Holder	Units	Pro-rata	Platform 30%	Investor keeps 70%
A	50	5,000	1,500	3,500
B	25	2,500	750	1,750
C	15	1,500	450	1,050
D	10	1,000	300	700
Total	**100**	**10,000**	**3,000**	**7,000**

Example figures do not represent the expected return of any project. Any projection in the product is labelled "Projected" and shown apart from "Actual" figures.

Distribution and claiming

- ✓ Monthly autopilot: early each month the system totals last month's data, files and reviews the report and releases the payout batch, with nothing for investors to do.
- ✓ Holdings are snapshotted at the end of each period; the contract computes every holder's amount from that snapshot.
- ✓ Holders claim for themselves (the operator may trigger a claim, but funds still go straight to the holder).
- ✓ Unclaimed amounts stay claimable indefinitely and are never swept to the operator.
- ✓ Rounding dust rolls into the next period; rounding favours investors.
- ✓ After the vehicle is sold at the end of the term, proceeds are returned pro rata in one go, with no platform share.

07 · TRANSFERS

Transfer market

Investors who want to exit early can list units on the platform's on-chain transfer market, where other investors buy them with USDT. The site's "Transfer market" page lists every unit for sale with its price and recent trades.

One atomic trade

The buyer's USDT and the seller's units change hands in the same transaction; partial fills are allowed.

No custody, no fee

The market contract never holds funds or units, charges no fee, and sellers set their own price.

Open to everyone

Any wallet that is not frozen can list and buy; the project must be in service, and the unit contract enforces the rules.

The platform may buy listings like any other buyer, but has no obligation to repurchase and guarantees no price, timing or fill. Units should be treated as illiquid.

Referral rewards and promotion teams

Investors can invite friends with their own link. Each time an invitee receives a payout, referrers earn rewards over up to three levels, paid entirely from the platform's 30%; the invitee's 70% is never touched. Rates apply to the invitee's gross payout; nothing from level 4 on, no limit on direct invites.

Reward rates

Level	Relationship	Reward
Level 1	People you invite directly	10%
Level 2	People they invite	5%
Level 3	People invited by level 2	3%

Worked example

illustration only

Referred investor X receives 1,000 USDT pro rata in a month; the referral chain is A → B → C → X:

Goes to	USDT	Source
Investor X keeps	700	Fixed 70%, unaffected by referrals
C (level 1)	100	Platform 30% (300 USDT)
B (level 2)	50	
A (level 3)	30	
Platform keeps	120	

Promotion teams

Leaders get a team link and a read-only back office; membership follows on-chain invites and members cannot be poached.

Claimed on-chain

Rewards are published as on-chain USDT claim proofs and claimed on the "Referral" page.

Never principal

Paid only from the platform's share, never from principal or the investor's 70%.

Switch-on condition: referral rewards have a master switch that is off by default on mainnet. Multi-level referral may be treated as pyramid selling or unlicensed sales in some jurisdictions, so counsel must confirm in writing before it is enabled on mainnet. Promotional material must never promise a fixed return.

09 · TRUST & SECURITY

Rules enforced by contracts

Evidence, not claims

Purchase, insurance and operating documents are hashed on-chain. A hash proves a file is unchanged, not that it is genuine, so each change is attested by a named role.

Four-eyes rule

Reports and payout batches are submitted by one party and approved by another; the automation also uses two separate keys, and one key cannot do both.

Multisig governance

Admin rights over every contract sit with a 2-of-3 multisig: any admin action needs at least 2 of 3 signers, so no single person can make changes. The deployer keeps no roles.

Bounded powers

No role can mint above the cap, divert escrow, rewrite records or move an investor's units. Contracts are built on OpenZeppelin and are not upgradeable.

Emergency pause

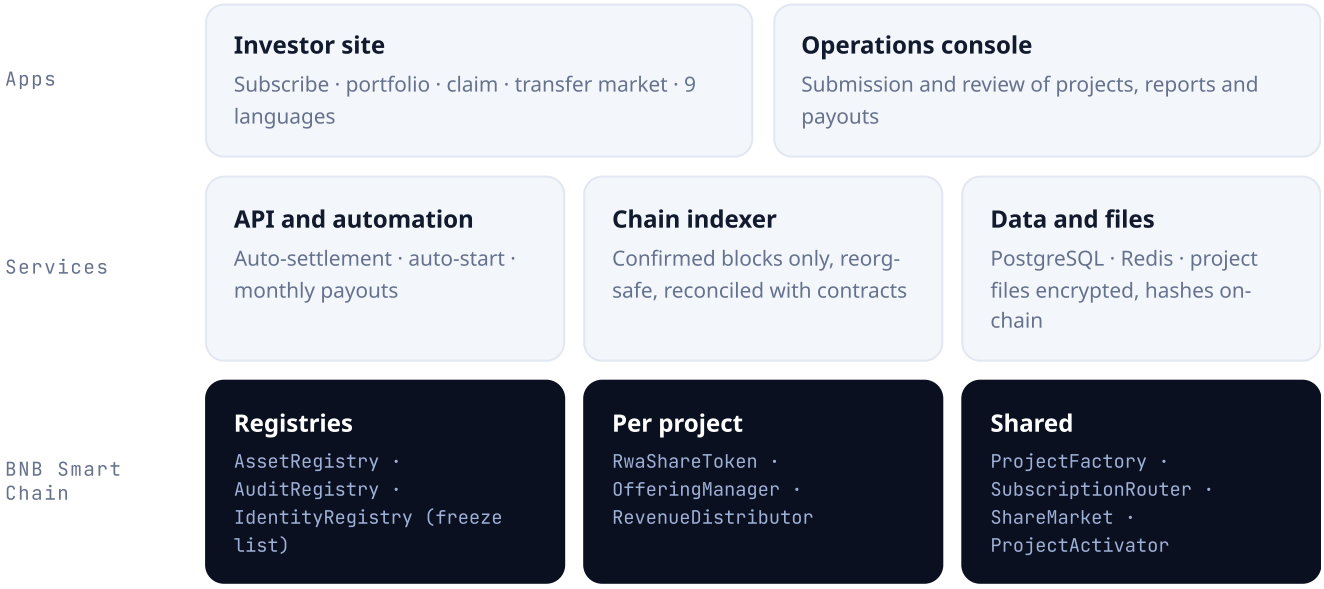

A separate pauser can halt contracts during an incident; unpausing requires governance.

Self-custody

Units and payouts live in the investor's own wallet. There is no key recovery and no forced transfer.

10 · TECHNOLOGY

Architecture

Payouts follow a reviewed monthly report; investor funds are never deposited into DeFi protocols.

11 · COMPLIANCE

Compliance and identity checks

A particular token structure or legal entity does not by itself make the platform compliant. Offering, transfer, custody, tax and data-protection duties depend on jurisdiction and on how the units are characterised legally, and must be settled by counsel before any public offering.

> **Current status:** the platform performs no KYC/AML identity checks; any wallet that is not frozen can subscribe, hold and transfer units. A freeze list blocks stolen or sanctioned wallets. If the law later requires identity checks, the platform may need to change its service or even pause subscriptions and transfers. Counsel must confirm this arrangement before mainnet.

12 · ROADMAP

Roadmap

Architecture and product design `done`
Rights structure, fees, offering and distribution rules defined.

Core contracts, backend and apps `done`
Unit, offering, distribution and transfer-market contracts; indexer and API; investor site and operations console.

Security testing and BSC testnet `Oct 2026`
All contracts governed by a 2-of-3 multisig; the deployer holds no roles.

Operating term, automation and transfer market `Oct 2026`
Per-vehicle terms; auto-settlement, automatic start of service and monthly payouts; site-wide transfer market; promotion teams and three-level referral rewards (off by default on mainnet).

Testnet trial `in progress`
End-to-end subscribe, auto-start, monthly payouts, claim and transfer with test USDT.

Launch readiness
External security audit, legal opinion (covering no KYC, automatic operation, the transfer market and multi-level referral), professional review of translations.

Mainnet
Only after all of the above and explicit written approval.

13 · KEY RISKS

Before you invest

You may lose part or all of your investment. Read the project's Rights Document, offering terms and the investor notes on the website before subscribing.

No guaranteed return

Payouts depend on actual profit after costs, reserves and fees; periods without profit pay nothing.

Vehicle and operations

Accidents, downtime, maintenance, depreciation, insurance, and changes at third-party autonomy and ride-hailing platforms.

Operator and issuer

Reports are submitted by the operator and approved by a reviewer; unless stated, they are not independently audited; before the close the platform may buy unsold units with its own funds.

Liquidity

A sale needs a buyer; you may not be able to sell at the price or time you want, and there is no redemption before the term ends.

Smart contracts and chain

Contracts may contain bugs; congestion, wallet faults or phishing sites.

Private keys

Losing your key permanently loses your units and payouts; nobody can recover them.

Stablecoin

USDT is issued by a third party and may depeg or be frozen; only approve spending on the official site, and revoke at any time.

Regulation and tax

No identity checks are performed, and laws may change and restrict or end a project; investors are responsible for their own taxes.

14 · NOTICE

Important notice

This whitepaper is a draft that describes the design of RoboShare. It is not an offer or solicitation to buy or sell any security or investment product, and it is not investment, legal or tax advice. No public offering is currently open.

It claims no partnership with any vehicle manufacturer or autonomy platform, no approved operating location, vehicle price, historical return, guaranteed yield or regulatory approval. The revenue split and referral rewards are proposed business rules; example figures only illustrate the calculation.

Each project's Rights Document and offering terms govern; where they differ from this paper, they prevail. This English version is a translation; the Chinese version is the reference text.

RoboShare

ROBOTAXI · RWA

Transparency, from the first unit.

RoboShare puts every vehicle's issuance, reports and payouts on-chain, so every holder can check for themselves.
